SEEDS OF WESTERN NATIVES & ALPINES

This list contains only perennial species of good garden value in foliage, flowering and growing habit and suited to Eastern climatic conditions. I have also included a few difficult species, hardy but temperamental, of which seeds have rarely been offered: Ceanothus prostratus, Phlox and Silene hookeri in particular belong to that group. It is my belief that adaptable strains may be grown from seed. Success has been obtained with Silene hookeri and Phlox diffusa. For the convenience of gardeners experimenting with Western natives I have indicated easily grown species with an asterisk (*).

This is not just another seed list. I personally have collected every single seed in this collection, selecting only the best color forms and the most sturdy strains. Neither time nor mileage has been spared to achieve this purpose. If you have had experience in growing plants for seeds you will be pleased with the results obtained with any variety selected from this list. If for any good reason you feel that I have not given you full satisfaction your money will be promptly refunded.

|------|--|
| Keys | <ul style="list-style-type: none"> (A) To be planted in compost of broken stones, leaf mold (oak or conifer) and loam in equal proportion in full sun. These will also do well in drained stony clay. (B) Poor stony soil-Rocks- full sun (C) Ordinary soil - full sun (D) Wood soil- acid- full to $\frac{1}{2}$ shade (E) Bog plants- full sun |
|------|--|

Cultural notes: While a few of the species listed are indifferent to soil reaction all will thrive in acid composts. Those requiring full sun should be planted where they will dry up completely in summer. Label these clearly as all growth disappears then.

Gabrielson's "Western American Alpines" and Preece's "North American Rock Plants" will prove useful for detailed description and additional cultural notes concerning many of the species listed.
